

U.S.SAWS™

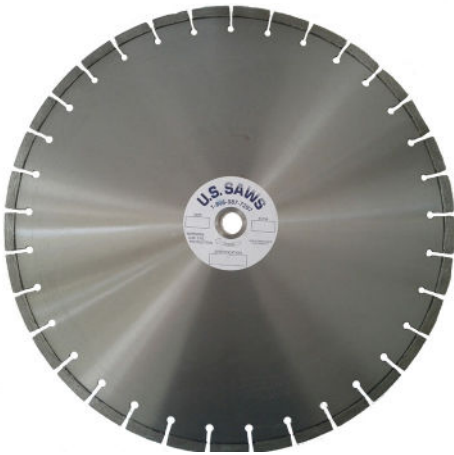

U.S.SAWS Pro Blades

Standard Grade: Diamond blades for low horsepower applications (25 hp or less) are engineered with lesser diamond content to reduce heat and draw. Specific blends allow faster cutting and good performance. Standard blades typically have slant or drop segments and a reduced count of kicker (undercut) segments as under cutting is less of an issue on these style blades. Typical segment height is 8.5mm/ 3/8". Recommend for wet cutting.

Premium Grade: Designed for Mid Horsepower saws (25-55hp) these blades offer higher diamond content for high speed and longer life. With higher power and longer life characteristics additional undercut protection, over standard grade, is installed to prevent core wear from abrasive slurry and sand. Several harder and soft sub-bond varieties are available to tune to your region and material application.

Professional Grade: Designed for the most powerful cutting saw (55-90hp) these blades offer the highest grade diamond grain and concentration per segment. These qualities provide extreme cutting speed at low cost per foot rates for expert contractors and pro cutters. The highest quantity of undercut protection is hand placed and deigned for core protection for miles of cutting life. Segment sub-bond varieties can be selected to ensure the longest life and highest performance.
