

U.S.SAWS™

HS HAND-HELD SAW

The U.S.SAWS hand-held, air-powered saws provide a reliable alternative to traditional gas-powered chop saws. Air-powered saws are more dependable, longer-lasting, and produce no harmful exhaust fumes, making them ideal for confined spaces, underground work, or indoor use. While gas-powered saws have traditionally been used for cutting depths of 4 inches or more, the air-powered option offers a cleaner and safer solution.

The HS Series saws are robust, direct-drive tools built for durability. With no additional moving parts, they deliver maximum power and longevity, ideal for heavy-duty construction cutting tasks. These saws require 90 CFM of air at 90 PSI to operate efficiently, ensuring reliable performance in demanding conditions.

Features:

- No gas engine emissions - significant for pile cutting and below-grade applications
- Low maintenance, lightweight design
- Oiler included for a quick check of fluid level
- Application allows for dry or wet cutting
- Constructed with a comfortable design for seamless cutting
- Air-powered design meaning no combustible parts
